

Can Prestige Beauty Diversify Suppliers Without Losing Margin?

Shari Nishida | Correlation One Data Analytics Program

BACKGROUND & PROBLEM

Prestige beauty runs on 70–80% gross margins, protected by concentrated, single-source suppliers. That concentration, not the tariffs themselves, is the real problem now threatening margin.

DATA

Three data sources, connected by product category:

Sourcing

100 products

Sephora

1.09M reviews

Trade Rules

US + EU tariffs

ENTERPRISE DATA MODEL

Model: each product category carries a tariff exposure score — cosmetics 25%, skincare 10%, haircare 0% — applied to production cost. This shows exactly where 2026 tariffs hit margin hardest, and which categories to move first.

PORTFOLIO DIAGNOSTICS & RESULTS

Supplier 4 fails 2 in 3 quality checks — the clear priority for dual-sourcing.

Follow-up: skincare & haircare fail most in Supplier 4 — 75% and 70%.

Skincare sells fastest, stocks thinnest — the category most exposed to running out.

Customer reviews surged 6.5x by 2020 — a reliable early-warning signal for demand.

HIGHLIGHTS

66.7%

Supplier 4 Failure Rate

Top priority for dual-sourcing

75% / 70%

Skincare & Haircare

Highest failure rates within Supplier 4

Skincare

Highest-Priority Category

Tightest stock, most stockouts, top rating

STRATEGIC NUANCE

Directional findings: this sample (100 products, ~98% margins) illustrates method, not statistical forecast. At real 70–80% margins, tariff gaps compound into material cost impact.

Quality and tariff risk are separate problems: haircare has no tariff exposure but the highest defect rate (2.48%) — both need their own fix.

From 2015 to 2020, review growth peaked at the price extremes: under-\$25 lines grew 14.0x and luxury \$200+ items grew 14.3x, outperforming the mid-tier's 7–11x growth.

Supplier concentration, not tariffs, is the biggest margin threat. Dual-source Supplier 4 first, then use skincare's demand signal to recalibrate safety stock.
